

## Groundwater-dependent ecosystems

*The Basin Plan 2012 requires that priority environmental assets and ecosystem functions dependent on groundwater are identified, considered, and actively managed.*

### Identifying and protecting groundwater-dependent ecosystems

Groundwater-dependent ecosystems are those that need access to groundwater to meet all or some of their water requirements necessary to maintain their plant and animal communities and ecological processes.

Water sharing plans for groundwater contain a schedule which identifies high-priority, groundwater-dependent ecosystems. These water sharing plans include rules to protect these ecosystems, such as restrictions on the construction of groundwater bores within specified distances from the groundwater-dependent ecosystems.

The NSW Department of Industry (the department) recently completed a program to identify and prioritise groundwater-dependent ecosystems in NSW.

The *High probability GDE method report* details the method used to identify groundwater-dependent ecosystems: [www.industry.nsw.gov.au/water/science/groundwater/ecosystems](http://www.industry.nsw.gov.au/water/science/groundwater/ecosystems).

### Management of groundwater-dependent ecosystems

Proposed changes in the draft *Water Sharing Plan for the Namoi Alluvial Groundwater Sources 2019* to manage groundwater-dependent ecosystems include:

- adding the recently identified high-priority, groundwater-dependent ecosystems into the water sharing plan schedule (shown in Figure 1)
- applying setback distance rules for new water supply works (including basic landholder rights bores).

The proposed new distances from a river will be:

- 100 metres from a river if the work will take water for basic landholder rights only
- 200 metres from a river for all other groundwater works

The proposed new distances from a high priority groundwater-dependent ecosystem will be:

- 100 metres in the Manilla Alluvial, Peel Alluvium and Upper Namoi Tributary Alluvium if the work will take water for basic landholder rights only
- 200 metres in the Lower Namoi and Upper Namoi if the work will take water for basic landholder rights only
- 200 metres for all other groundwater works, unless the Minister for Regional Water is satisfied that allowing the work to be located at a lesser distance will have no more than minimal impact, in all Namoi Alluvium groundwater sources

The setback distance rules will not apply to a water supply work used only for monitoring, environmental remediation activities or emergency services, or to replacement groundwater works. A replacement groundwater work is defined in the draft *Water Sharing Plan for the Namoi Alluvial Groundwater Sources 2019*.

The department will make an initial assessment of applications for new water supply work approvals located within the default setback distances. Water users may have the opportunity to mitigate potential impacts on high-priority, groundwater-dependent ecosystems through conditions on the work approval. These could

include conditions such as grout sealing the work to a specified depth, setting extraction limits or changing the proposed location.

If the initial assessment doesn't identify adequate mitigation measures, you may be required to submit further information, for example a hydrogeological study to support the application. This additional information will be considered by the department before the application for approval is determined.

Where a water supply work is currently located within the default setback distances, the work can continue to be used. If it becomes clear that there is a decline in the nearby groundwater-dependent ecosystem, the department will investigate the cause and possible remedial actions. These will be discussed with the water supply work approval holder.
