Concerns on finding accredited calibrators to check my race meters and the need for river water to test when flows are infrequent and even possibly non-existent in this current season for Gwydir area users.

One pump on average used ~~only~~ once every 3 years another 2-10 times a year, I raise concern on telemetry cost + whether its working for this infrequent use.

Requirements kept simple as not enough technicians in

the area now and also in flood or wet weather access to meters
can be difficult for these guys.

Would like a list of accredited calibrators for groundwater also
that can also validate these methods at equitable cost.

Thank you the opportunity to converse!
